Go cheatsheet

Introduction

Hello world

Variables

A tour of Go

(tour.golang.org)

Go repl

(repl.it)

Golang wiki

(github.com)

hello.go

```
package main

import "fmt"

func main() {
    message := greetMe("world")
    fmt.Println(message)
}
```

Variable declaration

```
var msg string
var msg = "Hello, world!"
var msg string = "Hello, wo
var x, y int
var x, y int = 1, 2
var x, msg = 1, "Hello, wor
msg = "Hello"
```

Constants

```
const Phi = 1.618
const Size int64 = 1024
const x, y = 1, 2
const (
    Pi = 3.14
    E  = 2.718
)
const (
    Sunday = iota
    Monday
    Tuesday
    Wednesday
    Thursday
    Friday
    Saturday
)
```

Constants can be character, string, boolean, or numeric values.  
See: [Constants](#)

Declaration list

Basic types

Strings

Numbers

Arrays

```
str := "Hello"
```

```
str := `Multiline
string`
```

Strings are of type string.

Typical types

```
num := 3           // int
num := 3.          // float64
num := 3 + 4i      // complex128
num := byte('a')  // byte (alias for uint8)
```

Other types

```
var u uint = 7      // uint (unsigned)
var p float32 = 22.7 // 32-bit float
```

```
// var numbers [5]int
numbers := [...]int{0, 0, 0,
```

Arrays have a fixed size.

Slices

```
slice := []int{2, 3, 4}
```

Pointers

Type conversions

```
func main () {
    b := *getPointer()
    fmt.Println("Value is", b)
```

https://devhints.io/go

1/6

<pre>}  func getPointer () (myPointer *int) {     a := 234     return &amp;a }</pre>	<pre>i := 2 f := float64(i) u := uint(i)</pre> <p>See: <a href="#">Type conversions</a></p>
<pre>a := new(int) *a = 234</pre>	
<p>Pointers point to a memory location of a variable. Go is fully garbage-collected.</p> <p>See: <a href="#">Pointers</a></p>	

# Flow control

Conditional	Statements in if	Switch
<pre>if day == "sunday"    day == "saturday" {     rest() } else if day == "monday" &amp;&amp; isTired() {     groan() } else {     work() }</pre> <p>See: <a href="#">If</a></p>	<pre>if _, err := doThing(); err != nil {     fmt.Println("Uh oh") }</pre> <p>A condition in an if statement can be preceded with a statement.</p> <p>See: <a href="#">If with a short statement</a></p>	<pre>switch day { case "sunday":     // cases don't "fall through"     fallthrough case "saturday":     rest() default:     work() }</pre> <p>See: <a href="#">Switch</a></p>
For loop	For-Range loop	While loop
<pre>for count := 0; count &lt;= 10; count++ {     fmt.Println("My counter is at", count) }</pre> <p>See: <a href="#">For loops</a></p>	<pre>entry := []string{"Jack", "John", "Jones"} for i, val := range entry {     fmt.Printf("At position %d, the character %s is present\n", i, val) }</pre> <p>See: <a href="#">For-Range loops</a></p>	<pre>n := 0 x := 42 for n != x {     n := guess() }</pre> <p>See: <a href="#">Go's "while"</a></p>

# Functions

Lambdas	Multiple return types	Named return values
<pre>myfunc := func() bool {     return x &gt; 10000 }</pre> <p>Functions are first class objects.</p>	<pre>a, b := getMessage()  func getMessage() (a string, b string) {     return "Hello", "World" }</pre>	<pre>func split(sum int) (x, y int) {     x = sum * 4 / 9     y = sum - x     return }</pre> <p>By defining the return value name.</p> <p>See: <a href="#">Named return values</a></p>

## ⚡ Packages

### Importing

```
import "fmt"
import "math/rand"
```

```
import (
    "fmt"      // gives fmt.Println
    "math/rand" // gives rand.Intn
)
```

Both are the same.

See: [Importing](#)

### Aliases

```
import r "math/rand"

r.Intn()
```

### Packages

```
package hello
```

Every package file has to start with package.

### Exporting names

```
func Hello () {
    ...
}
```

Exported names begin with capit

See: [Exported names](#)

## ⚡ Concurrency

### Goroutines

```
func main() {
    // A "channel"
    ch := make(chan string)

    // Start concurrent routines
    go push("Moe", ch)
    go push("Larry", ch)
    go push("Curly", ch)

    // Read 3 results
    // (Since our goroutines are concurrent,
    // the order isn't guaranteed!)
    fmt.Println(<-ch, <-ch, <-ch)
}
```

```
func push(name string, ch chan string) {
    msg := "Hey, " + name
    ch <- msg
}
```

Channels are concurrency-safe communication objects, u

See: [Goroutines](#), [Channels](#)

### Buffered channels

```
ch := make(chan int, 2)
ch <- 1
ch <- 2
ch <- 3
// fatal error:
// all goroutines are asleep - deadlock!
```

Buffered channels limit the amount of messages it can ke

See: [Buffered channels](#)

### Closing channels

Closes a channel

```
ch <- 1
ch <- 2
ch <- 3
close(ch)
```

Iterates across a channel until its clos

```
for i := range ch {
    ...
}
```

Closed if ok == false

```
var ok := <- ch
```

### WaitGroup

```
import "sync"
```

```
func main() {
    var wg sync.WaitGroup

    for _, item := range itemList {
        // Increment WaitGroup Counter
        wg.Add(1)
        go doOperation(&wg, item)
    }
    // Wait for goroutines to finish
    wg.Wait()
}
```

```
func doOperation(wg *sync.WaitGroup, item string) {
    defer wg.Done()
    // do operation on item
    // ...
}
```

A WaitGroup waits for a collection of goroutines to finish. The main goroutine calls Add to set calls wg.Done() when it finishes. See: [WaitGroup](#)

## Error control

### Defer

```
func main() {
    defer fmt.Println("Done")
    fmt.Println("Working...")
}
```

Defers running a function until the surrounding function returns. The arguments are evaluated before the function is called.

See: [Defer, panic and recover](#)

### Deferring functions

```
func main() {
    defer func() {
        fmt.Println("Done")
    }()
    fmt.Println("Working...")
}
```

Lambdas are better suited for defer blocks.

```
func main() {
    var d = int64(0)
    defer func(d *int64) {
        fmt.Printf("& %v Unix Sec\n", *d)
    }(&d)
    fmt.Print("Done ")
    d = time.Now().Unix()
}
```

The defer func uses current value of d, unless we use a pointer

## Structs

### Defining

```
type Vertex struct {
    X int
    Y int
}
```

```
func main() {
    v := Vertex{1, 2}
    v.X = 4
    fmt.Println(v.X, v.Y)
}
```

See: [Structs](#)

### Literals

```
v := Vertex{X: 1, Y: 2}
```

```
// Field names can be omitted
v := Vertex{1, 2}
```

```
// Y is implicit
v := Vertex{X: 1}
```

You can also put field names.

### Pointers to structs

```
v := &Vertex{1, 2}
v.X = 2
```

Doing v.X is the same as doing (\*v).X

## Methods

### Receivers

```
type Vertex struct {
    X, Y float64
}
```

```
func (v Vertex) Abs() float64 {
    return math.Sqrt(v.X * v.X + v.Y * v.Y)
}
```

```
v := Vertex{1, 2}
v.Abs()
```

There are no classes, but you can define functions with receivers.

### Mutation

```
func (v *Vertex) Scale(f float64) {
    v.X = v.X * f
    v.Y = v.Y * f
}
```

```
v := Vertex{6, 12}
v.Scale(0.5)
// `v` is updated
```

By defining your receiver as a pointer (\*Vertex), you can do mutations.

See: [Pointer receivers](#)

See: [Methods](#)

# Interfaces

## A basic interface

```
type Shape interface {
    Area() float64
    Perimeter() float64
}
```

## Methods

```
func (r Rectangle) Area() float64 {
    return r.Length * r.Width
}

func (r Rectangle) Perimeter() float64 {
    return 2 * (r.Length + r.Width)
}
```

The methods defined in Shape are implemented in Rectangle.

## Struct

```
type Rectangle struct {
    Length, Width float64
}
```

Struct Rectangle implicitly implements interface Shape by imp

## Interface example

```
func main() {
    var r Shape = Rectangle{Length: 3, Width: 4}
    fmt.Printf("Type of r: %T, Area: %v, Perimeter: %v\n", r, r.Area(), r.Perimeter())
}
```
